

Developing Cloud Native Applications

Module 2 Glossary: Getting Started with IBM Cloud

Term	Definition
IBM Cloud	An open cloud computing platform that combines infrastructure as a service (IaaS) with platform as a service (PaaS), and includes a catalog of diverse cloud services, which can be used to rapidly build and deploy business applications or infrastructure.
Cloud Foundry	An open-source platform as a service offering that provides a choice of clouds, frameworks, and application services. It provides the monitoring, deployment, and logging tools for hosting apps.
Runtime	A set of resources that is used to run an application. Each runtime features an associated build pack, which is a collection of scripts that prepares code to run on IBM Cloud.
Tomcat	An open-source Java web application server.
IBM WebSphere Liberty	A Java application server which can deploy any Tomcat application.
Region	A defined geographical territory to which you can deploy your applications.
Locations	Data centers within a region in which hardware is deployed.
IBM Cloud Code Engine	A service that provides a fully managed, serverless platform to run containerized workloads, including web apps, microservices, event-driven functions, or batch jobs.
Eclipse Tools for IBM Cloud	Allows you to work on Cloud Foundry applications within the Eclipse integrated development environment.
Cloud IAM	“Cloud Identity and Access Management” is used to manage user identity.
Resource	An entity in your account that you create from the IBM Cloud catalog, such as a provisioned instance of an IBM Cloud service; for example, Cloudant, a Cloud Foundry application, a virtual machine, or a container.
Resource Controller	Manages the lifecycle of cloud resources.
Quota	The resource limits for an organization, including the number of services and the amount of memory that can be allocated for use by the organization.
